Costs of Children in Australia

There are two important differences between results obtained by using the basket-of-goods method and the expenditure survey method as presented in the accompanying Tables. First, the basket-of-goods approach provides only part of the cost of a child, while the expenditure survey measures the total amount spent on the child. Second, the basket-of-goods method indicates how much parents would spend on their children if the child was to enjoy the fruits of the basket specified by the researcher. In this sense, it provides an 'ideal' or desirable costing. In contrast, the expenditure survey method indicates how much parents actually spend on their children, even though the amount spent might be considered inadequate or excessive by the objective standards of the basket-of-goods method.
